"description": "CardSelectorWidgetArguments defines the arguments for a card selection widget.\n\nAttributes:\n cards (str): A JSON string representing an array of card objects. Each object must have:\n - card_name (str, required): The user's card name to display in the cards list. This value should also be sent to MAIA under the 'text' field when the item is clicked.\n - card_number (str, required): The card number to display in the cards list.\n - card_button_title (str , None): Custom label for the cards button.\n - card_image_url (str, optional): URL to an image file to display in the card's list item. This can also be a data URL in the form ` data:[\u003Cmediatype\u003E][;base64],\u003Cdata\u003E` .\n - payload (str, required): The value to be sent back to MAIA under the 'system_text' field when the item is clicked.\n\nThe 'cards' field expects a string containing a valid JSON array of the above objects."

"DETERMINE_INTENT_PROMPT_TEMPLATE": {

"anyOf": [

{

"type": "string"

},

{

"type": "null"

}

],

"title": "Determine Intent Prompt Template",

"default": "System:\nYou are an intent extraction system that processes user messages and splits them into structured intents.\n\nInput:\n- Previous intent: The intent from the user's last message (if any)\n- Current query: The user's current message\n\nOutput:\n- A JSON list of intent objects, each containing: message, is_greeting_or_chitchat, and search fields\n\n## CORE PRINCIPLES\n\n**Accuracy**: Extract only what the user actually said. Do not add, infer, or hallucinate information not present in the message.\n\n**Focus on User Needs**: Identify and preserve actual requests, questions, or problems the user wants addressed. Discard irrelevant tangents.\n\n**Language Consistency**: Keep all output in the same language as the user's input.\n\n**Always Extract Something**: If the user has written anything at all, you MUST extract at least one intent. Never return an empty list [] unless\nthe input is completely empty. Even for unclear or vague messages, extract what the user said as-is.\n\n## PROCESSING RULES (apply in order)\n\n### 1. SPLITTING: When to Create Separate Intents\n\nSplit the message into separate intents when it contains:\n\na) **Multiple independent requests or questions about DIFFERENT topics**\n - \"Where are your ATMs?\" + \"Can I apply for a loan?\" → 2 intents (different topics)\n - \"I want to block my card\" + \"How do I open a savings account?\" → 2 intents (different

actions/services)\n - **Do NOT split** if questions/sentences are about the SAME topic, product, or action\n - **Do NOT split** if one part elaborates on or clarifies the other part\n - Examples of what to KEEP as 1 intent:\n - \"How can I apply for a Visa Platinum Card, and what are the requirements?\" → 1 intent (same topic: Visa Platinum Card)\n - \"Your webpage only shows 404. Is this some kind of secret code?\" → 1 intent (same problem: webpage error)\n\nb) **Greetings + Requests/Questions**\n - Separate greetings from actual requests, questions, or problems\n - \"Hello, I need help\" → 2 intents: greeting + request\n - \"Hi! Just wanted to drop by and say hello!\" → 1 intent (all greeting/chitchat)\n - Only split if there's substantive content (request, question, problem) alongside the greeting\n\nc) **Polite Expressions + Requests/Questions**\n - Separate polite expressions from actual requests or questions\n - \"Thanks for your help. Can I get a loan?\" → 2 intents\n - \"Thank you so much! Have a great day!\" → 1 intent (all polite chitchat)\n - Only split when thank you is separate from an actual request\n\n### 2. MERGING: When to Combine into One Intent\n\nMerge into a single intent when:\n\na) **Same Topic or Subject**\n - All sentences/questions are about the same product, service, topic, or problem\n - \"How can I apply for a Visa Platinum Card, and what are the requirements?\" → 1 intent\n - \"Your webpage only shows 404. Is this some kind of secret code?\" → 1 intent\n\nb) **Elaboration or Clarification of the Same Topic**\n - \"I need a loan. I want to buy a car.\" → 1 intent (loan for car)\n - \"Block my card. I lost it yesterday.\" → 1 intent (block card because lost)\n - Later sentences provide details, reasons, or clarifications about the first\n\nc) **Context that Explains the Request**\n - \"My salary was late. I need a repayment delay.\" → 1 intent (delay because of late salary)\n - Include relevant context that explains **why** the user needs something\n\nd) **Rephrasing or Redundant Information**\n - \"I want to cancel my card, please cancel it\" → 1 intent (avoid repetition)\n\ne) **Pure Greeting/Chitchat Content**\n - \"Hi! Just wanted to drop by and say hello!\" → 1 intent (all greeting)\n - \"Thank you so much! Have a great day!\" → 1 intent (all polite expressions)\n - If the entire message is social pleasantries without any request, keep it as one intent\n\n### 3. FILTERING: What to Exclude\n\n**Exclude** information that is:\n\na) **Tangential and Not Actionable**\n - \"My mom told me about X, but I want to do Y\" → Only keep Y\n - \"Someone mentioned X. I have a question about Y\" → Only keep Y\n - If the user explicitly redirects (\"but\", \"actually\", \"just\"), follow their focus\n\nb) **Already Captured in Another Intent**\n - \"Block my card. Thanks for blocking my debit card.\" → Intent 1: \"Block my debit card\", Intent 2: \"Thanks\"\n - Remove redundant details from thank-you messages\n\nc) **Not a Request, Question, or Problem**\n - Conversational filler without intent\n - Statements that don't require action or response\n\n### 4. GREETING AND CHITCHAT CLASSIFICATION\n\nMark `\"is_greeting_or_chitchat\": true` **only** when the intent contains **exclusively**:\n- Greetings: \"Hello\", \"Good morning\", \"Hi\"\n- Thanks: \"Thank you\", \"Thanks\"\n- Polite phrases: \"Please\", \"Excuse me\"\n\nMark `\"is_greeting_or_chitchat\": false` for:\n- All requests, questions, or user needs\n-

Mixed content (e.g., \"Please help me\" → False, it's a request)\n\n**Handling Duplicated Information in Polite Phrases:**\n- If \"Thank you for X\" and X is already captured in another intent → Use only \"Thank you\"\n- If \"Thanks for X\" and X contains NEW information → Extract X to the main intent, use only \"Thanks\"\n\n### 5. SEARCH INTENT GENERATION\n\nFor each non-greeting intent, create a concise search query:\n\na) **Extract the Core Need**\n - Message: \"I'm having trouble logging into my account\" → Search: \"trouble logging in\"\n - Message: \"Where can I find ATMs in Prague?\" → Search: \"find ATMs in Prague\"\n\nb) **Preserve Specific Details**\n - Include specific terms: account types, card types, amounts, locations\n - \"Why is my savings account interest 9.99%?\" → \"why is my savings account interest rate 9.99%% so low?\"\n\nc) **Use Full Message if Unclear**\n - If the core need isn't easily distilled, use the entire message as search query\n\nd) **Empty for Greetings**\n - Greetings and chitchat always have `\"search\": []`\n\ne) **Language Consistency**\n - Keep search in the same language as the message\n - If message is \"Kde najdu bankomat?\", search is \"kde najdu bankomat?\" (not translated)\n\n### 6. PREVIOUS INTENT CONTEXT\n\nUse previous intent to:\n- Detect topic shifts (user moved to entirely new subject → ignore previous context)\n- Recognize continuations (user answering or elaborating → may reference previous context)\n- Avoid repeating information already covered\n\nIf the user explicitly changes topic, do not reference or carry over previous intent.\n\n**Requirements:**\n- `message`: Complete, grammatically correct sentence in the user's language\n- `is_greeting_or_chitchat`: Boolean (true only for pure greetings/thanks)\n- `search`: A list of 0–2 search queries. Use 0 for pure greetings/no-information intents.\n For all other intents, prefer 2 complementary queries whenever it could improve retrieval coverage\n (e.g., broader + more specific, synonyms, or key entities + task phrasing). Use 1 only when a second query would be redundant.\n\n## EXAMPLES\n\nHuman:\nPrevious intent: None\nCurrent query: Hello, I have trouble logging in.\nAI:\n[\n {{\n   \"message\": \"Hello\",\n   \"is_greeting_or_chitchat\": true,\n   \"search\": []\n }},\n {{\n \"message\": \"I have trouble logging in.\",\n   \"is_greeting_or_chitchat\": false,\n \"search\": [\"trouble logging in\", \"having trouble logging into my account\"]\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Please block my card. Thanks for blocking my debit card.\nAI:\n[\n {{\n   \"message\": \"Please block my debit card.\",\n   \"is_greeting_or_chitchat\": false,\n   \"search\": [\"block my debit card\"]\n }},\n {{\n   \"message\": \"Thanks\",\n   \"is_greeting_or_chitchat\": true,\n   \"search\": []\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Thank you for sending me the address.\nAI:\n[\n {{\n   \"message\": \"Thank you\",\n \"is_greeting_or_chitchat\": true,\n   \"search\": []\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Hello, I want to request a repayment delay. I can't pay this month because my salary was late. Can you help? Thanks.\nAI:\n[\n {{\n \"message\": \"Hello\",\n   \"is_greeting_or_chitchat\": true,\n   \"search\": []\n }},\n {{\n   \"message\": \"I want to request a repayment delay because my salary was late.

Can you help?\",\n \"is_greeting_or_chitchat\": false,\n \"search\": [\"request repayment delay\"]\n }},\n {{\n \"message\": \"Thanks\",\n \"is_greeting_or_chitchat\": true,\n \"search\": []\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Good day, I want to block my credit card, and my mom told me about the interest on the TOP account. I just want to block the credit card because I lost it.\nAI:\n[\n {{\n \"message\": \"Good day\",\n \"is_greeting_or_chitchat\": true,\n \"search\": []\n }},\n {{\n \"message\": \"I want to block my credit card because I lost it.\",\n \"is_greeting_or_chitchat\": false,\n \"search\": [\"blocking credit cards\", \"lost credit card\"]\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Hello, I have a savings account with you that shows 0.99%% interest. I'm seriously considering switching banks. Why is the interest rate so low?\nAI:\n[\n {{\n \"message\": \"Hello\",\n \"is_greeting_or_chitchat\": true,\n \"search\": []\n }},\n {{\n \"message\": \"I have a savings account with you showing 0.99%% interest. I'm seriously considering switching banks. Why is the interest rate so low?\",\n \"is_greeting_or_chitchat\": false,\n \"search\": [\"why is my savings account interest rate 0.99%% so low?\", \"savings account interest 0.99%%\"]\n }}\n]\n\nHuman:\nPrevious intent: None\nCurrent query: Dobrý den, kde najdu pražské bankomaty a kolik se za ně platí?\nAI:\n[\n {{\n \"message\": \"Dobrý den\",\n \"is_greeting_or_chitchat\": true,\n \"search\": []\n }},\n {{\n \"message\": \"Kde najdu pražské bankomaty a kolik se za ně platí?\",\n \"is_greeting_or_chitchat\": false,\n \"search\": [\"kde najdu pražské bankomaty a poplatky\"]\n }}\n]\n\nHuman:\nPrevious intent: {previous_intent}\nCurrent query: {question}\n"

"ENTITIES_EXTRACTION_AND_UPDATE_PROMPT_TEMPLATE": {

"type": "string",

"title": "Entities Extraction And Update Prompt Template",

"default": "System:\nYour task is to either extract entity values from a user's input or update previously extracted entity values based on a user's new input.\n\n# Functionality\n\n1. Entity Extraction: If values for expected entity or other entities to extract are present, extract their values from the user's input.\n2. Entity Update: If extracted entities are provided, determine whether the user intends to update any values and apply the necessary changes.\n\nYou are provided with:\n- The user's

current input which may contain a value for extraction or entity update.\n- Expected entity metadata which user likely answers with his input.\n- Metadata about the entity, including its ID, allowed values, data type, and the question originally asked to obtain the entity's value.\n- If applicable, a list of previously extracted entities with their values.\n- If available, a chat history of a previous conversation.\n\n# General Extraction and Update Rules\n\n- If a value of expected entity is present in the user input, extract its value from the user's input.\n- Check if values of other entities to extract are mentioned in the provided user input and extract their values.\n- If previously extracted entities are provided, check whether the user's input explicitly corrects any of them.\n- If the user's input contains only a raw value (e.g., \"200\", \"USD\") without explicitly expressed intent for correction:\n - Do not update any already extracted entity, just update the expected or other entities for extraction.\n- Use the chat history only for entity updates, not for extraction.\n- If no valid updates are identified, return an empty JSON object {{}}.\n\n# Entity Value Mapping\n\n- If allowed values for an entity are provided, map the extracted value to one of the exact allowed values.\n- Singular and plural forms of values should be treated as equivalent.\n- If allowed values are not present, return the extracted value directly from the user's input.\n- The extracted values must be in the correct data type:\n - \"text\" - JSON value must be a string or null.\n - \"enum\" - JSON value must be one of the allowed values or null.\n - \"boolean\" - JSON value must be a boolean (true/false) or null.\n - \"number\" - JSON value must be a number or null.\n\n# Ownership & Relation Handling\n\n- Do not infer ownership or personal relation just because the message contains first-person pronouns. Wait for a direct expression of ownership.\n\n# Output Format\n\n- Always return extracted or updated values in **valid JSON format**, following the examples below.\n\n# Chat History for an Entity Update\n\n{chat_history}\n\n# Examples\n\nHuman:\nExpected entity to be extracted: {{\"question_to_user\": \"How much do you want to transfer?\", \"id\": \"amount\", \"data_type\": \"number\", \"allowed_values\": []}}\nOther entities to extract: []\nExtracted entities: {{}}\nUser's input: I want to transfer 500 euros.\nAI:\n{{\"amount\": 500}}\n\nHuman:\nExpected entity to be extracted: {{\"question_to_user\": \"What type of a card is it?\", \"id\": \"card_type\", \"data_type\": \"enum\", \"allowed_values\": [\"credit_card\", \"debit_card\"]}}\nOther entities to extract: []\nExtracted entities: {{}}\nUser's input: I lost my credit card, how can I block it?\nAI:\n{{\"card_type\": \"credit_card\"}}\n\nHuman:\nExpected entity to be extracted: {{}}\nOther entities to extract: [\n {{\"question_to_user\": \"What type of a card is it?\", \"id\": \"card_type\", \"data_type\": \"enum\", \"allowed_values\": [\"credit_card\", \"debit_card\"]}}\n]\nExtracted entities: {{}}\nUser's input: I lost my card, how can I block it?\nAI:\n{{}}\n\nHuman:\nExpected entity to be extracted: {{\"question_to_user\": \"Which currency?\", \"id\": \"currency\", \"data_type\": \"enum\", \"allowed_values\": [\"euro\", \"dollar\", \"pound\"]}}\nOther entities to extract: []\nExtracted entities: {{}}\nUser's input: eur\nAI:\n{{\"currency\": \"euro\"}}\n\nHuman:\nExpected entity to be extracted: {{\"question_to_user\": \"Are you sure?\", \"id\": \"confirmation\",

"type": "string"

},

"type": "object",

"title": "Fields",

"description": "The `fields` detail the assembly of argument objects for the message widget. Each item in `items_from` corresponds to an object passed to the widget, containing the specified fields. Utilize substitution syntax and the `item` variable, representing the current list element, to define field values in these objects. For example, `card_name: \"{item.foo}/{item.bar}\"` assigns to `card_name` in each object passed to the message widget a string constructed by concatenating the `foo` and `bar` attributes of the objects taken from `items_from`, separated by a '/'. The field `payload` can be set to a string that the frontend sends back to MAIA as `system_text` when one item of a widget is selected. This can be used for example as `/route{\"route_id\":\"block_card\",\"card_number\":\"{item.card_number}\"}`, which calls a specific route `block_card` with the variable `card_number` already defined.",

"examples": [

{

"card_name": "{item.name}",

"card_number": "{item.number}"

},

{

"field1": "Card title {item.title}",

"field2": "Card amount {item.amount}",

"title": "System Text",

"description": "\nSystem payload describing a message - e.g. payload of clicked button. For manually typed/spoken messages this should be almost always omitted.\n\nUsual system messages have the following form: `/\u003Cname\u003E\u003Coptional-json-object\u003E`. Typical usage of system messages is for the `payload` of buttons.\nTo support various use-cases, we support several system message types:\n - `close` system message to tell the bot about the end of the conversation. The frontend would typically send this on\n behalf of the user after the user closes the conversation and optionally provide rating that needs to be stored in conversation logs:\n - `/close{{\"rating\":5,\"feedback\":\"Text from user\",\"resolution\":true,\"reason\":\"bot_not_reachable\"}}`\n - `/close{{\"rating\":2,\"feedback\":\"Text from user\",\"resolution\":false,\"reason\":\"user_not_reachable\"}}`\n - `/close{{\"rating\":3,\"feedback\":\"Text from user\",\"resolution\":true,\"reason\":\"agent_not_reachable\"}}`\n - `/close{{\"rating\":4,\"feedback\":\"Text from user\",\"resolution\":false,\"reason\":\"user_exited\"}}`\n - `/close{{\"rating\":1,\"feedback\":\"Text from user\",\"resolution\":false,\"reason\":\"agent_exited\"}}`\n - `/close{{\"rating\":3,\"feedback\":\"Text from user\",\"resolution\":true,\"reason\":\"other\"}}`\n\n - `inform` system message to inform bot about new values of the variables - this is typically set as payload of buttons that are part of bot's ask messages:\n - `/inform{{\"card_type\":\"credit\"}}`\n - `/inform{{\"card_type\":\"debit\",\"account_type\":\"personal\"}}`\n\n - `dialog` (deprecated, use `route` instead).\n\n - `route` system message to force activation of the mentioned route and optionally provide new values of the variables - this can be used to forcely the currently active route of the bot:\n - `/route{{\"route_id\":\"agent_exited\"}}` - use to activate the route that handles the situation in which the agent left the conversation handed over to them (after being done with helping the visitor).\n - `/route{{\"route_id\":\"agent_not_reachable\"}}` - use to activate route that handles the situation that communication with contact center software and/or agent failed.\n - `/route{{\"route_id\":\"agent_exited\",\"some_variable\":\"some_value\"}}` - `route_id` specifies which route to activate. In the same JSON object you can define further attributes\n (e.g. `some_variable`, etc.) to provide new values for any variable, same

as with the `/inform` system message.\n - `/route{{\"route_id\":\"user_inactive\"}}` - use to activate the route that handles the situation in which the user does not react. Note that this route does not need to be called explicitly as it will\n anyways be activated by MAIA when there is no reaction from the user for a configurable number of seconds (`USER_INACTIVE_TIMEOUT_SECONDS` which defaults to `300`).\n\n - `action` system message to force performing of external action and optionally provide new values of the variables:\n - `/action{{\"action_id\":\"action_send_email\",\"body\":\"Hello!\"}}` - just an example, but provided that `action_send_email` is implemented for the bot,\n this would cause the action to be called without changing the current route and context of the conversation.\n\n**Please note double brackets `{{` and `}}` in examples above.** They are needed because we preprocess every `system_text` with templating logic.\nDuring templating sub-strings with brackets like `{var_name}` are substituted with the actual value of the `var_name` variable. Double brackets tell\nthe templating logic that characters `{` (or `}` respectively) should be outputted into the resulting `system_text`.\n"

"title": "Metadata",
"description": "\nMetadata (string key-value pairs) to be assigned to conversation and made available for bot and dialog logic.\n\nIt is common to provide user-related information here. For example following are good key-value pairs:\n- `channel` - contains name of the channel from where user is writing (e.g. `mobile`, `web`, ...)\n- `segment` - contains user's bank segment (e.g. `retail`, `business`, ...)\n- `area` - contains main location of the user (e.g. `west`, `east`, ...)\n\nEach of the provided keys will be made available as variable to the dialogue designer for use in conditional dialogues.\nIf the passed key is called `key`, the corresponding variable will get the prefix `metadata_` and thus be called `metadata_key`.\n\nNOTE: above are just examples, it is up to the caller to provide relevant keys/values and up to the dialog designer to use them.\n"

   {
    "name": "vamb-channel",
    "description": "\nThis API specification describes the interface to exchange messages with\nMAIA-based bots.\n\nThere are two basic concepts:\n- conversations and\n- messages.\n\nA conversation can be thought of as an active session. It holds all\nvalues that are invariant throughout the conversation. A conversation is\nidentified by its unique conversation_id.\n\nA message is the building block of conversations. Messages come from\neither the `user`, the `bot`, or an `agent` (i.e., human operator in the\ncall-center) as specified by the `sender` attribute of a message. One\nmessage corresponds to one bubble rendered on the frontend. A single\nresponse can contain multiple messages.\n\nYou can interact with the API either through synchronous (HTTP requests\ntake a bit to complete but directly return bot answers to user message\nas result) or asynchronous mode (HTTP requests complete almost immediately;\nbot answers will be sent once ready to a webhook URL you provide in the\nasynchronous request). The semantics are the same. Pick the `-async`\nvariant for webhooks-based asynchronous mode or the variant without\npostfix for synchronous mode.\n\nThe MAIA backend also makes API calls back to the conversation orchestrator in two cases:\n\n- as response to an `-async` call or\n- to check if a human operator is available.\n\nFor the bot response case:\n\n- MAIA sends a POST HTTP request to the `new_messages_webhook_url` that was provided in the `-async` request.\n- The POST request contains a JSON body with the same schema as used in `GET /conversation-messages/{conversation_id}`\n- The POST request body contains `event_id` string field that can be used to correlate webhook call with `-async` endpoint call\n- The POST request contains the x-*-token headers with the values taken from the `-async` request\n\nFor the agent availability check:\n\n- The environment variable `VAMB_CHANNEL_HANDOVER_URI` needs to be provided as configuration for the MAIA backend\n  - Value of `VAMB_CHANNEL_HANDOVER_URI` can contain variables in curly brackets (e.g `{metadata_channel}`) that are substituted before sending HTTP request.\n    Note the `metadata_` prefix which needs to be used to reference variables provided as conversation's metadata.\n  - Possible value might be: `https://my-handover-service.com?channel={metadata_channel}&segment={metadata_segment}&area={metadata_area}`\n- MAIA sends a POST HTTP request to `VAMB_CHANNEL_HANDOVER_URI` (after substituting any variables in the URL) with
```

the following body:\n ```\n { \"conversation_id\": \"\u003CID-OF-CONVERSATION-TO-HANDOVER\u003E\", \"metadata\": \u003CMETADATA-OBJECT-OF-THE-CONVERSATION\u003E }\n ```\n- MAIA expects a status code of 200 if a human handover was successful; and non-200 status code otherwise\n- The POST request contains the `x-*-token` headers with the values taken from the last incoming request of that particular conversation\n"
